binding antibody fragment (I), that preferentially binds cell-associated

CX 125/0772P polypeptide relative to shed CA 125/0772 polypeptide. Also

CX 125/0772P polypeptide relative to shed CA 125/0772 polypeptide. Also

CX a monoclonal antibody that competes with binding of (II); (3) a hybridoma

SX deposited in (II); (4) an isolated nucleic acid molecule (III)

CX as deposited in (II); (4) an isolated nucleic acid molecule (III)

CX antigen-binding antibody tragment that preferentially binds cell-

CX antigen-binding antibody fragment that preferentially binds cell-

CX antigen-binding antibody fragment that preferentially binds cell-

CX antigen-binding antibody or an antigen-binding monoclonal antibody fragment

CX (I); (5) a pharmaceutics (A 125/072P

CX (I); (5) a pharmaceutical composition comprising a

CX antigen-binding antibody or an antigen-binding monoclonal antibody fragment

CX (I); (5) a pharmaceutically binds cell-associated CA 125/0772P

CX (I); (6) a pharmaceutically binds cell-associated CA 125/0772P

CX (I); (7) an antibody, or an antigen-binding antibody fragment that

CX (I); (8) and a carrier contained within the packaging material, and

CX (I); (9) and pharmaceutically binds cell-associated CA

CX (I); (10) an antibody (VX) comprising an antibody, or an antigen-binding

CX (I); (10) a monoclonal antibody (VX) (Chosen from 325.1, 621.1, 633.1, 654.1, 725.1, 8G9, 77F10, 8A1, 8A63, 18C9, 8E3, 8B5, 7G10, 16C7, 7C6, 7H1, 16H9, 17H1, 4E7, 117.1, 36B.1, 446.1, 501.1, and 776.1 or its antigen-binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel isolated antibody, or antigen-binding antibody fragment binding with cell-associated CA 125/0772P polypeptide relative to shed CA 125/0772 polypeptide, useful for ameliorating cervical or ovarian cancer.

antibody fragment; (11) an antibody or antigen binding antibody fragment that competes with (VI); and (12) a pharmaceutical composition comprising (VI) and a carrier. (I) has cytostatic activity, and can be used as an immunostimiant and a mediator of lysis of positive tumour cell. (I) is useful for ameliorating a symptom of a CA 125/O77P-related disorder which is a cell proliferative disorder such as cancer, cervical or uterine cancer, breast or lung cancer or ovarian cancer. (V) is useful diagnostically for monitoring the development or progression of cancer or tumour as part of clinical testing procedure. The present sequence represents the CA 125/O772P 3-repeat amino acid sequence, which is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 540

Novel isolated antibody, or antigen-binding antibody fragment binding with cell-associated CA 125/0772P polypeptide relative to shed CA 125/0772 polypeptide, useful for ameliorating cervical or ovarian cancer.

Example; SEQ ID NO 2; 153pp; English

The present invention describes an isolated antiloody, or an antigen-binding antiloddy fragment (1), that preferentially binds cell-associated described: (1) a monoclonal antiloddy (II) produced by hybriddom 4E7; (2) a monoclonal antibody that competes with binding of (III); (3) a hybriddom 4E7; (2) a monoclonal antibody that competes with binding of (III); (3) a hybriddom 5C a deposited in (II); (4) an isolated mucleic acid molecule (III) comprising a nucleotide sequence that encodes a variable chain region of (I); (5) a pharmaceutical composition comprising an antibody fragment that preferentially binds cell-associated CA 125/0772P polypeptide relative to shed CA 125/0772P polypeptide relative to shed CA 125/0772P polypeptide cannoclonal antibody fragment that preferentially binds cell-associated CA 125/0772P polypeptide comprising an antibody or an antigen-binding antibody fragment that chart preferentially binds cell-associated CA 125/0772P polypeptide comprising an antibody or an antigen-binding antibody fragment that composition in a form suitable for administration to a subject; (8) a composition in a form suitable for administration to a subject; (8) a composition in a form suitable for administration to a subject; (8) a composition in a form suitable for administration to a subject; (9) antibody fragment, which preferentially binds cell-associated CA 125/0772P polypeptide (V) comprising an antibody or an antigen-binding antibody fragment, which preferentially binds cell-associated CA 125/0772P polypeptide (V) comprising or antibody or an antigen-binding cantibody fragment, which preferentially binds cell-associated CA 125/0772P relative to shed CA 125/0772P polypeptide (V) comprising or antibody fragment, which preferentially binds cell-associated CA 125/0772P related to shed CA 125/0772P related to shed CA 125/0772P related to shed CA 125/0772P related day antibody or antibody fragment, (II) and carrier (II) a monoclonal antibody or antipod carrier (II) and carrier (II) and carrier (II) and carrier (I present invention describes an isolated antibody, or

This invention relates to polypeptides comprising an immunogenic portion of an ovarian carcinoma protein which acts as an immunostimulant and is cytostatic. The polypeptides, polynucleotides, antibodies, fusion proteins, T cell populations and antigen presenting cells that express the polypeptides are useful for stimulating an immune response in a patient and treating ovarian cancer. This sequence represents protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Polypeptides comprising an immunogenic portion of an ovarian carcinoma protein or its variants, useful for stimulating an immune response in a patient and treating ovarian cancer.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes an isolated polypeptide comprising an immunogenic portion of an ovarian carcinoma protein (or its variants). Ovarian carcinoma proteins, and polynucleotides encoding them, have cytostatic activity and can be used in gene therapy and vaccines. Ovarian carcinoma polypeptides, nucleic acids, antibodies and vaccines are useful for the prevention, diagnosis and treatment of cancer, preferably ovarian cancer. AAA69691 to AAA70077 and AAB12552 to AAB12557 represent human ovarian carcinoma polynucleotides and proteins used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        INNIERYMADMGQPGSEKFWITDNVWKHLLSPLFQRSSLGARYTGCRVIALRSVKNGAETR 317

The invention relates to an isolated 0772P polypeptide, which has the structure fully defined in the specification. The composition containing the polypeptides, polynucleotides, fusion proteins, antibodies, T-cells or antigen presenting calls are useful for stimulating an immune response and treating ovarian cancer. Detecting the presence of the polynucleotides and polypeptides is useful for diagnosing cancer. Ovarian carcinoma cDNAs and protein cDNAs were identified using microarray technology. The present sequence represents a human ovarian carcinoma
                                                                                                                                                                                                        New isolated 0772P polypeptides and polynucleotides, useful in gene therapy, particularly for treating or diagnosing cancer, e.g. ovarian cancer.
                                                                                                                                                                                                                                                    Example 2; SEQ ID NO 389; 371pp; English

samples, and therefore which patients may be in need of restorative therapy. The host cell may also be used as antigens in the production of antibodies against (II) and in assays to identify modulators of (II)'s expression and activity. The anti-(II) antibodies, agonists and antiagonists may be used to regulate expression and activity and as diagnostic agents for detecting the presence of (II) in samples (e.g. bimmunoassay). This sequence represents a secreted ovarian carcinoma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                GVTQLGFYVLDRDSLPINGYAPQNLSIRGEYQINFHIVNWNLSNPDPTSSEYITLLRDIQ

                                                                                                                                                                                                                                                                                                                                                           8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention describes nucleic acids (I) and the polypeptides (II) they encode. The nucleic acids (I) may be used for preventing, diagnosing and treating diseases related to their aberrant expression i.e. breast cancers. For example, (I) and (II) may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of (II) by expressing inactive proteins or to supplement the patients own production of (II). Additionally, (I) may be used to produce (II), by inserting (I) into a host cell and culturing the cell to express the protein (II). (I) And its complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acids in

                                                                                                                                                                                                                                                                                                                                                                                                              요
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to human ovarian carcinoma polypeptides, designated OBE or 0772P, and the polynucleotides encoding them. The invention also relates to methods for inhibiting the development of cancer, e.g. ovarian cancer in a patient, methods for stimulating and/or expanding T cells and methods for identifying secreted tumour antigens. The polypeptides, compositions, antibodies to the polypeptides and methods are useful for diagnosing, preventing, treating and monitoring cancer, e.g. ovarian cancer. The composition is particularly useful for stimulating an immune response in patient. This sequence represents a human ovarian carcinoma polypeptide of the invention.

the specification, its complement or degenerate variants, or a sequence of at least 20 contiguous residues of the 849 or 1399 bp sequence. The polynucleotides and polypeptides are useful for diagnosing, preventing and treating diseases, such as ovarian cancer, and for eliciting humoral and/or cellular immune response. This sequence corresponds to an ovarian carcinoma antigen protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         DKVTTLYKGSQLHDTFRFCLVTNLTMDSVLVTVKALFSSNLDPSLVEQVFLDKTLNASPH

                                                                                                                                                                                                                                                                                                                                         The present invention describes an isolated polypeptide comprising an immunogenic portion of an ovarian carcinoma protein (or its variants). Ovarian carcinoma proteins, and polypucleotides encoding them, have cytostatic activity and can be used in gene therapy and vaccines. Ovarian carcinoma polypeptides, nucleic acids, antibodies and vaccines are useful for the prevention, diagnosis and treatment of cancer, preferably ovarian cancer. AAA69691 to AAA70077 and AAB12552 to AAB12557 represent human everain carcinoma polymucleotides and proteins used in the exemplification of the present invention
                                                                                                                                                                                                                                                                    acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  PLFQKSSMGPFYLGCQLISLRPEKDGAATGVDTTCTYHPDPVGPGLDIQQLYWELSQLTH

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to human breast tumour protein coding sequences (see AAH55479-AAH55513, AAH55517-AAH55679 and AAH55682-AAH55762). The breast tumour protein DNA sequences may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate expression of the breast tumour protein e.g. breast cancer. The present sequence is a human ovarian tumour-derived antigen, which was used in an example from the present invention

                                                                                                                                                                                                                                                                                                                                                                                             218
                                                                                                                                                                                                                                                                                                                                                                                                                                      This invention relates to polypeptides comprising an immunogenic portion of an ovarian carcinoma protein which acts as an immunostimulant and is cytostatic. The polypeptides, polymuleotides, antibodies, fusion proteins, T cell populations and antigen presenting cells that express the polypeptides are useful for stimulating an immune response in a patient and treating ovarian cancer. This sequence represents protein

The polypeptides, polynucleotides, antibodies, fusion proteins, T cell populations and antigen presenting cells that express the polypeptides are useful for stimulating an immune response in a patient and treating ovarian cancer. This sequence represents protein related to the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Polypeptides comprising an immunogenic portion of an ovarian carcinoma protein or its variants, useful for stimulating an immune response in spatient and treating ovarian cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       FTHRSSVSTTSTPGTPTVYLGASKTPASIFGPSAASHLLILFTLNFTINLRYEENWWPG

The invention describes an isolated breast cancer polymucleotide (I) comprising a sequence (SI) selected from the 249 mucleotide sequence (II) defined in the specification, complements of SI, a sequence that fully defined in the specification, complements of SI, a sequence that the specification comprising at least 20 contiguous residues of SI, a sequence that the comprising at least 75%, preferably 90% identity to SI, or degenerate variants of SI. Also described are: an isolated polypeptide (II) encoded by (I), or expression vector (III); a host cell (V) transformed or transfected with certain isolated antibody (Ab) that specifically binds to (II); an isolated antibody (Ab) that specifically binds to (II); detecting (MI); an oligonucleotide (VI) that hybridiess to SI; detecting (MI); an oligonucleotide (VI) that hybridiess to SI; detecting (MI); an oligonucleotide (VI) that hybridiess to SI; detecting (MI); an oligonucleotide (VI) that hybridiess to SI; detecting (MI); an antispop presenting cells that express (II); a composition (C) comprising physiologically acceptable carriers and inhibiting (M3) the development of a cancer in a patient. (V) is an antispop presenting cells that express (II); and inhibiting (M3) the development of a cancer in a patient. (VI) is an eaful for determining the presence of cancer in a patient, by obtaining a biological sample from the patient, contacting the biological sample with a monoclonal antibody that binds to OSE, isolating cells that bind to the antibody that binds to OSE, isolating polymucleotides from the isolated cells, and comparing the amount of polymucleotides with (VI), detecting an encount polymucleotides with (VI), detecting an encount polymucleotides with (VI) are useful in pharmaceutical compositions. (C) is useful for cut-off value, and thus determining the presence of cancer in a patient, and thus determining the presence of cancer in a patient. (I) is useful for detecting the presence of cancer in a patient. (I) is useful for detecting the presence of cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           133

The invention describes an isolated breast cancer polynucleotide (I) comprising a sequence (SI) selected from the 249 nucleotide sequences

Claim 2; SEQ ID NO 206; 237pp; English.

comprising at least 20 contiguous residues of S1, a sequence that hybridize to S1, under moderately stringent conditions, a sequence that hybridize to S1, under moderately stringent conditions, a sequence that hybridize to S1, under moderately stringent conditions, a sequence having at least 75%, preferably 90% identity to S1, or degenerate variants of sequence (S2) selected from any one of the 11 sequences mentioned in the specification, sequences encoded by (1), or sequences having at least (CC 70%, preferably 90% identity to (1); an expression control sequence; a host comprising (1), operably linked to an expression control sequence; a host comprising (II), perably linked to an expression control sequence; a cell (IV) transformed or transfected with (III); an isolated antibody (A) of the interpretably linked to an expression control sequence; an isolated T cell population (VII), comprising (II); an oligonuclectide (VI) that specific for a tumor protein; an isolated T cell population (VII), comprising T cells prepared by (M2); an isolated T cell population (VII), comprising T cells prepared by (M2); an isolated T cell population (VII), comprising T cells prepared by (M2); an isolated T cell population (VII), comprising T cells prepared by (M2); an isolated T cell population (VII), comprising T cells prepared by (M2); and industring the development of a diagnostic kit (VIII) comprising (VI), or Ab and a detection reagent comprising a reporter group; and inhibiting (M3) the development of a patient, and therefore inhibiting presenting cells that express (II), so that T cell proliferate, administering the proliferated T cells to the compositions comprising are disclosed; monitoring the progression of dagnostic methods. (C) is useful for stimulating immune response in a patient, and for treating antisense oligonuclectide; and kit for use in dagnostic methods. (C) is useful for stimulating in patient of in pharmaceutical compositions.

CC determining the presence of cancer in a patient of a cancer in the cumor pol cancer. (C) is useful for inhibiting the development of breast cancer in a patient, and for removing tumor cells from a biological sample. Ab (binding agent for (I)) is useful for detecting the presence of cancer in a patient. This is the amino acid sequence of a breast cancer associated protein. Note: This sequence has been extracted from the sequence listing of a corrected version of the specification published on the 3rd of March 518 218 133 278 193 253 313 458 TPKPATTFLPPLSEATTAMGYHLKTLTLNFTISNLQYSPDMGKGSATFNSTEGVLQHLLR 373 374 PLFQKSSMGPFYLGCQLISLRPEKDGAATGVDTTCTYHPDPVGPGLDIQQLYWELSQLTH 433 398 73 INNLRYMADMGQPGSLKFNITDNVMGHLLSPLFQRSSLGARYTGCRVIALRSVKNGAETR VDLLCTYLQPLSGPGLPIKQVFHELSQQTHGITRLGPYSLDKDSLYLNGYNEPGPDEPPT SRKFNTTERVLQGLLRPLFKNTSVGPLYSGGRLTLLRPEKDGEATGVDAICTHRPDPTGP VDLLCTYLQPLSGPGLPIKQVFHELSQQTHGITRLGPYSLDKDSLYLNGYNEPGPDEPPT TPKPATTFLPPLSEATTAMGYHLKTLTLNFTISNLQYSPDMGKGSATFNSTEGVLQHLLR INNLRYMADMGQPGSLKFNITDNVMKHLLSPLFQRSSLGARYTGCRVIALRSVKNGAETR GLDREQLYLELSQLTHSITELGPYTLDRDSLYVNGFTHRSSVPTTSTGVVSEEPFTLNFT PTHRSSVSTTSTPGTPTVYLGASKTPASIFGPSAASHLLILFTLNFTITNLRYEENMMPG SRKFWITTERVLOGLIARPLFKWTSVGPLYSGCRLTLIARPEKDGEATGVDAICTHRPDPTGP Gaps ; 0 92.9%; Score 3663; DB 5; Length 914; 99.9%; Pred.   and treating ovarian cancer. Detecting the presence of the polymorlectides and polymorles is useful for diagnosing cancer. Ovar carcinoma cDNAs and protein cDNAs were identified using microarray technology. The present sequence represents a human ovarian carcinoma.
                                                                                                                                                                                                                                                                                      159 FIHRSSVSTTSTPGTPTVYLGASKTPASIFGPSAASHLLILFTLNFTITNLRYERNWWPG

The composition containing the polypeptides, polynucleotides, fusion proteins, antibodies, T-cells or antigen presenting cells are useful for stimulating an immune response

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention describes nucleic acids (I) and the polypeptides (II) they encode. The nucleic acids (I) may be used for preventing, diagnosing and treating diseases related to their aberrant expression i.e. breast

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to an isolated 0772P polypeptide, which has the structure fully defined in the specification. The composition containing the polypeptides, polynucleotides, fusion proteins, antibodies, T-cells or antigen presenting cells are useful for stimulating an immune response and treating ovarian cancer. Detecting the presence of the polynucleotides and polypeptides is useful for disgnosing cancer. Ovarian carcinoma cDNAs and protein CDNAs were identified using microarray technology. The present sequence represents a human ovarian carcinoma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              FTHRSSVSTTSTPGTPTVYLGASKTPASIFGPSAASHLLILFTLNFTITNLRYEENMWPG 218

cancers. For example, (I) and (II) may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient segment that affect the activity of (II) by expressing inactive proteins or to supplement the patients own production of (II).

Additionally, (I) may be used to produce (II), by inserting (I) into a complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acids in camples, and therefore which patients may be in need of restorative therapy. The host cell may also be used as antigens in the production of antibodies against (II) and in assays to identify modulators of (II)'s expression and activity. The anti-(II) antibodies, agonists and chargonists may be used to respression and activity and as chargonists may be used to regulate expression and activity and as diagnostic agents for detecting the presence of (II) in samples (e.g. by imminoassay). This sequence represents a secreted ovarian carcinoma

## Example 2; SEQ ID NO 312; 399pp; English.

The invention describes nucleic acids (I) and the polypeptides (II) they encode. The nucleic acids (I) may be used for preventing, diagnosing and treating diseases related to their aberrant expression i.e. breast cancers: For example, (I) and (II) may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of (II) by expressing in circiive proteins or to supplement the patients own production of (II). Additionally, (I) may be used to produce (II), by inserting (I) into a host cell and culturing the cell to express the protein (II). (I) And its complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acids in camples, and therefore which patients may be in need of restorative therapy. The host cell may also be used as antigens in the production of antibodies against (II) and in assays to identify modulators of (II)'s expression and activity. The anti-(II) antibodies, agonists and cativity and as antigonists may be used to regulate expression and activity and as diagnostic agents for detecting the presence of (II) in samples (e.g. by immunoassay). This sequence represents a secreted ovarian carcinoma

The invention relates to human ovarian carcinoma polypeptides, designated OBE or 0772P, and the polymucleotides encoding them. The invention also relates to methods for inhibiting the development of cancer, e.g. ovarian cancer in a patient, methods for stimulating and/or expanding T cells and methods for identifying secreted tumour antigens. The polypeptides, compositions, antibodies to the polypeptides and methods are useful for diagnosing, preventing, treating and monitoring cancer, e.g. ovarian cancer. The composition is particularly useful for stimulating an immune response in patient. This sequence represents a human ovarian carcinoma polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  INNIRYMADMGQPGSLKFNITDDNVMKHILSPLFQRSSLGARYTGCRVIALRSVKNGAETR

The present invention relates to polynuclectide and polypeptide sequences associated with breast cancer. Also disclosed are expression vectors comprising the polynuclectide sequences of the invention operably linked to an expression control sequence, host cells comprising the vector, antibodies (or antigen binding fragments of antibodies) specifically binding the polypeptides of the invention, fusion proteins comprising at least one of the polypeptides, stimulating and/or expanding T cells specific for a tumour protein. The polynuclectide sequences, polypeptide sequences, and antigen presenting cells can be administered they can be included with a physiological carrier/immunostimulant in compositions such as vaccines, particularly to treat or prevent cancers such as breast cancer. They can also be used to inhibit the development of cancer by incubating one or more of them with CD4+ and/or CD8+ T cells isolated from a patient, such that the T cells proliferate, and administering the producing one or more of them with CD4+ and/or CD8+ T cells isolated from a patient, such that the T cells proliferate, and administering the useful for detecting cancer in a patient, producing fusion proteins, producing T cell populations and antigen presenting cells. The present sequence represent
